

Agentic AI

Product Launch Planner

Problem Statement :

Launching a product requires synchronized market research, cross-functional planning, audience profiling, and marketing content — all happening in the right order, with the right information flowing between each step. Today, founders, product managers, and marketing teams do this manually, switching between tools, doing their own research, and writing their own content. A simple chatbot cannot solve this. It answers one question at a time, has no memory between steps, and cannot autonomously chain tasks together. A multi agent system is necessary because different specialized agents must handle different domains, pass outputs to each other, use real tools like web search, and work autonomously toward a unified goal.

Who is this for:

- **Primary** — Startup Founders who need end-to-end launch guidance with no team support.
- **Secondary** — Product Managers in MNCs who need structured, research-backed plans fast.
- **Tertiary** — Marketing Teams who need audience insights and messaging ready quickly.

Need of the Project :

Every day, thousands of great product ideas fail not because the product is bad, but because the launch was poorly planned. Our system gives anyone — a first-time founder, a small team, someone with no marketing background — access to the same quality of launch planning that big companies pay agencies thousands of dollars for. We are democratizing product launch expertise.
